

## **Amendments to the Claims**

Please amend the claims as detailed below. This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) In a mobile client device, a method of operation comprising:
  - first providing, by the mobile client device, a first audio signal at a first audio volume level to a user;
  - determining by the mobile client device, the first audio volume level at which the mobile client device is being utilized by the user for the first audio signal; and
  - second providing, by the mobile client device, to the user a second audio signal at a second audio volume level, the second audio volume level being based at least in part on non-intrusively lower than the first audio volume level initially; and
  - while providing the first and second audio signals, incrementally increasing, by the mobile client device, the second audio volume level from the initial non-intrusive lower volume level; to a discernable the increased second audio volume level being different from higher than the first audio volume level.
2. (Original) The method of claim 1, wherein said determining comprises the mobile client device determining a first audio volume level at which the mobile client device is being utilized by a user for a first audio signal corresponding to music associated with output of at least one of an MP3 player and a radio included with the mobile client device.
3. (Currently amended) The method of claim 1, wherein said second providing comprises the mobile client device providing the second audio signal corresponding to a ring tone associated alert for at least a selected one from the group consisting of an incoming call, a received indication of a text message, a received indication of a voicemail message, a calendar alert, and a wireless mobile phone system utilities warning.

4. (Cancelled)
5. (Previously Presented) The method of claim 1, wherein said incrementally increasing comprises incrementally increasing the second audio volume level to a pre-determined audio volume level limit above which hearing damage is likely to occur.
6. (Previously Presented) The method of claim 1, wherein said incrementally increasing comprises incrementally increasing the second audio volume level by a selected one of a constant increment and an increasing increment.
7. (Previously Presented) The method of claim 1, wherein said determining comprises the mobile client device determining the first audio volume level measured as an audio power level.
8. (Previously Presented) The method of claim 7, wherein said determining comprises the mobile client device determining the first audio volume level measured as at least one of volts, watts, and decibels.
9. (Previously Presented) The method of claim 1, wherein said first and second providing comprises the mobile client device mixing said first and second audio signals.
10. (Currently amended) A wireless mobile phone comprising:  
a first audio resource, the first audio resource equipped to provide a first audio signal at a first audio volume level at which the mobile phone is being utilized by a user for the first audio signal; and  
a second audio resource, wherein the second audio resource is equipped to provide a second audio signal at a second audio volume level to the user, the second audio volume level being based at least in part on non-intrusively lower than the first audio volume level initially, and  
when the wireless mobile phone provides the first and second audio signals, incrementally increase the second audio volume level from the initial

non-intrusive volume level, to a discernable the increased second audio volume level being different from higher than the first audio volume level, and terminating the second audio signal preventing the second audio signal from intruding on the first audio signal in response to an user action.

11. (Previously Presented) The wireless mobile phone of claim 10, wherein the first audio resource comprises at least one of an MP3 player and a radio.
12. (Original) The wireless mobile phone of claim 10, wherein the second audio resource comprises an audio resource equipped to receive a delivery of a message alert to the user.
13. (Original) The wireless mobile phone of claim 12, wherein the audio resource equipped to receive a delivery of a message alert comprises a ring tone generator.
14. (Currently Amended) The wireless mobile phone of claim 12, wherein the audio resource is equipped to receive a delivery of a message alert for at least a selected one from the group consisting of an incoming call, a received indication of a text message, a received indication of a voicemail message, a calendar alert, and a wireless mobile phone system utilities warning.
15. (Cancelled)
16. (Previously Presented) The wireless mobile phone of claim 10, wherein the second audio resource is equipped to incrementally increase the second audio volume level to a predetermined audio volume level limit above which hearing damage is likely to occur.
17. (Previously Presented) The wireless mobile phone of claim 10, wherein second audio resource is equipped to incrementally increase the second audio volume level by

a selected one of a constant increment and an increasing increment.

18. (Previously Presented) The wireless mobile phone of claim 10, wherein the first and second audio volume levels are measured as audio power levels.

19. (Previously Presented) The wireless mobile phone of claim 18, wherein the audio power levels are measured in at least one of volts, watts, and decibels.

20. (Original) The wireless mobile phone of claim 10, further comprising a mixer, the mixer equipped to mix the first and second audio signals.

21-28 (Cancelled)

29. (Currently amended) A mobile client device comprising:

a storage medium having stored therein a plurality of programming instructions, which when executed, the instructions cause the mobile client device to

first provide a primaryfirst audio signal at a first audio volume level to a user,

determine the primaryfirst audio volume level at which the mobile client device is being utilized by the user for the primaryfirst audio signal, and

second provide a secondary audio signal at a second audio volume level to the user, the second audio volume level being-based-at-least-in-partnon-intrusively lower than on the first audio volume level initially, and

when the mobile client device provides the first and secondary audio signals,

incrementally increase the secondary audio volume level from the initial non-intrusive volume level, to a discernable the increased second audio volume level being different fromhigher than the first audio volume level; and

a processor coupled to the storage medium to execute the programming instructions.

30. (Currently Amended) The mobile client device of claim 29, wherein the primary~~first~~ audio signal corresponds to music associated with output of at least one of an MP3 player and a radio included with the mobile client device.

31. (Currently Amended) The mobile client device of claim 29, wherein the secondary~~audio~~ signal corresponds to a ring tone associated alert for at least a selected one from the group consisting of an incoming call, a received indication of a text message, a received indication of a voicemail message, a calendar alert, and a wireless mobile phone system utilities warning, and the programming instructions are further configured to terminate the secondary audio signal preventing the secondary audio signal from intruding on the primary audio signal in response to an user action.

32. (Cancelled)

33. (Currently Amended) The mobile client device of claim 29, wherein the primary~~first~~ audio volume level is measured as an audio power level.
